

- What do I want to learn or understand better?

I started learning the github workflow, but along the way there were other programs and more terminology that I had to learn that works parallel with github. What I want to learn is how everything works together and become more comfortable using these tools in future projects and of course in this project right now.

Working with tasks individually and splitting up the work is good and time effective. However I feel like I only learn the parts I do and not what my teammates are working on. I would like to learn how to do the tasks they do as well. I get a better understanding when I am part of the bigger picture. For example last week some of my teammates worked on creating the map and displaying it on android studio. This week my task was to add a destination on the map. I struggled a lot, it was my first time using android studio and they had already created multiple java files and other files. Getting a hang of how things were connected took a lot of time for me to figure out. I understand that I can't always be part of the bigger picture but maybe there is a way, maybe agile working teaches something about this.

- How can I help someone else, or the entire team, to learn something new?
- What is my contribution towards the team's use of Scrum? What is my contribution towards the team's deliveries?

I helped a team mate who also struggled with understanding the github workflow by trying to understand the task and help the team mate google some solutions. We ended up asking another teammate for further clarification. Asking questions and trying my best to help others is my way of contributing to the team's use of Scrum.

I finished task 18 together with a teammate this week and worked a lot on task 4 but didn't complete it. I am stuck at the moment but we discussed it on the meeting today and I have made more progress than I think and will be done very soon.
